

ABSTRACT OF THE DISCLOSURE

A system for transmitting data over computer networks which comprises:
data processing means;

storage means controlled by the data processing means;

5 modulation/demodulation means suitable to provide a connection of the
data processing means to a data network;

data entry means and data display means;

its particularity consisting in that the storage means comprise a
temporary data structure which is suitable to store information related to at
10 least one Web page to be played back subsequently, either online and
offline; and

means for generating a data file which is suitable to be stored in the
memory means and to contain the information related to the at least one
Web page.
